Disclaimer

FQore Trading Blueprint is an educational publication created to help beginners and developing traders understand how financial markets work. Nothing in this e-book constitutes financial, investment, tax, or legal advice.

● EDUCATIONAL PURPOSE ONLY

All concepts, charts, and examples in this book are provided solely to build market knowledge. They are illustrative and should not be copied as trade instructions.

● NOT FINANCIAL ADVICE

FQore is not a SEBI-registered investment advisor. Nothing here should be treated as personalised advice for your specific financial situation.

● NO GUARANTEED RETURNS

Trading and investing involve substantial risk of loss. Past performance, backtests, and hypothetical setups never guarantee future results.

● NO BUY/SELL RECOMMENDATIONS

This book does not recommend any specific stock, index, currency pair, or asset. Always do your own research or consult a licensed advisor before acting.

By continuing to read, you acknowledge that all trading decisions and their outcomes remain entirely your own responsibility.

INSIDE THIS BOOK

Table of Contents

01	Trading Fundamentals	04	12	Risk Management	17
02	Market Structure	05	13	Risk / Reward & Expectancy	18
03	Candlestick Mastery	06	14	Trading Psychology	19
04	Support & Resistance	08	15	Trading Journal	20
05	Chart Patterns	09	16	Backtesting & Practice	21
06	Moving Averages	11	17	30-Day Learning Roadmap	22
07	Volume Analysis	12	18	Trader Operating System	23
08	Technical Indicators	13	19	Common Problems & Solutions	24
09	Trading Strategy Framework	14	20	Personal Trading Plan	25
10	Breakout Setup	15	21	Master Trading Checklist	26
11	Pullback Setup	16	22	Final Chapter	27

CHAPTER 01

Trading Fundamentals

Before charts and strategies, every trader needs a working understanding of what the stock market actually is and how it functions.

What Is the Stock Market?

The stock market is an organised marketplace where shares of publicly listed companies are bought and sold. It allows companies to raise capital for growth, and gives investors a chance to own a share of that growth.

How Buyers and Sellers Interact

Every trade is an agreement between a buyer and a seller at a mutually accepted price. Prices move continuously because participants constantly revise what they are willing to pay or accept, based on new information and sentiment.

EXCHANGES

NSE — National Stock Exchange
BSE — Bombay Stock Exchange
Centralised, regulated venues
that match buy & sell orders

MARKET PARTICIPANTS

Retail investors (individuals)
Institutional investors (funds)
Brokers (trading platforms)
Regulators (e.g. SEBI)

INVESTING VS TRADING

Investing: long-term ownership
for compounding growth
Trading: short-term positions
based on price movement

REMEMBER

The market moves based on the balance of supply and demand — not on emotion or prediction.

CHAPTER 02

Market Structure

Markets move in one of three directions. Learning to read structure is the first skill every trader must develop — it tells you which way the crowd is leaning before you plan a trade.

UPTREND
Higher Highs, Higher Lows

DOWNTREND
Lower Highs, Lower Lows

SIDEWAYS
Range-Bound Consolidation

Reading Swing Points

HH

Higher High
A swing high that forms above the previous swing high.

HL

Higher Low
A swing low that forms above the previous swing low.

LH

Lower High
A swing high that forms below the previous swing high.

LL

Lower Low
A swing low that forms below the previous swing low.

CHAPTER 03

Candlestick Mastery

Each candlestick tells a short story about the fight between buyers and sellers within a period. Learning to read that story is core to technical analysis.

Anatomy of a Candle

High — highest traded price

Open / Close — body range

Low — lowest traded price

Wick — price rejected beyond body

Bullish: Close above Open

Bearish: Close below Open

Single-Candle Signals

● Bullish Candle

Close > Open

● Bearish Candle

Close < Open

● Doji

Indecision

● Hammer

Bullish reversal

● Inverted Hammer

Bullish reversal

● Shooting Star

Bearish reversal

● Hanging Man

Bearish warning

● Spinning Top

Balanced pressure

CHAPTER 03 — CONTINUED

Multi-Candle Reversal Patterns

These patterns form across two or three candles and often carry more reliability than single-candle signals because they show a confirmed shift in control.

● Bullish Engulfing

Large bullish candle fully covers prior bearish body

● Bearish Engulfing

Large bearish candle fully covers prior bullish body

● Morning Star

Bearish candle, small indecision candle, then strong bullish candle

● Evening Star

Bullish candle, small indecision candle, then strong bearish candle

● Bullish Harami

Small bullish candle contained within prior large bearish body

● Bearish Harami

Small bearish candle contained within prior large bullish body

A single candle is a clue, not a conclusion — always read patterns in the context of trend, structure, and volume.

CHAPTER 04

Support & Resistance

Support and resistance are price zones where buying or selling pressure has historically been strong enough to pause or reverse a move.

Key Concepts

Breakout

Price closes decisively beyond a support/resistance zone, signalling a potential new direction.

Retest

Price returns to the broken zone to confirm it now acts as the opposite role (old resistance becomes new support).

Rejection

Price approaches a zone and reverses without breaking through, reinforcing the level's strength.

False Breakout

Price briefly breaks a zone but fails to hold, quickly reversing back — a common trap for impatient entries.

CHAPTER 05

Chart Patterns

Chart patterns are recurring price shapes formed by the ongoing battle between buyers and sellers. They help frame probability, not certainty.

Reversal Patterns

Patterns describe probability, not certainty — always wait for a confirmed close and volume support before acting.

CHAPTER 05 — CONTINUED

Continuation Patterns

Continuation patterns are pauses within an existing trend. They often resolve in the direction of the prior move once consolidation ends.

Reading Any Pattern

- Identify the prevailing trend before the pattern formed
- Mark the pattern's boundary lines clearly on the chart
- Wait for a decisive close beyond the boundary
- Confirm with volume expansion on the break
- Plan entry, stop-loss and target before acting

CHAPTER 06

Moving Averages

A moving average smooths price into a single flowing line, helping traders see the underlying trend without the noise of every candle.

SMA — Simple Moving Average

Averages closing prices equally over a period. Smoother, but slower to react.

EMA — Exponential Moving Average

Weights recent prices more heavily. Reacts faster to new momentum.

The MA Stack

When shorter-period averages sit above longer-period averages, in order, the trend is aligned and considered healthy.

"Trend is your friend — trade with it, not against it."

CHAPTER 07

Volume Analysis

Volume measures how many shares changed hands. It tells you how much conviction sits behind a price move — the fuel behind the direction.

Reading Price + Volume Together

- **Price up + Volume up**
Strong, healthy uptrend
- **Price down + Volume up**
Strong, healthy downtrend
- **Price moves + Volume down**
Weak or potentially false move

Practical Use

- Always check volume at the moment of a breakout
- Rising volume alongside price confirms the move is real
- Volume contraction during a pause often precedes expansion

CHAPTER 08

Technical Indicators

Indicators translate price and volume into a simplified reading. They support a decision — they should never replace price action and structure.

RSI — Relative Strength Index

Measures the speed and magnitude of recent price changes on a 0–100 scale, used to gauge overbought or oversold conditions.

70 — overbought

30 — oversold

MACD

Tracks the relationship between two EMAs. Crossovers and histogram shifts hint at changing momentum.

Bollinger Bands

Plots volatility bands around a moving average. Price hugging a band signals strength; squeezes often precede expansion.

Indicators are not guaranteed signals — always combine them with structure and volume.

CHAPTER 09

Trading Strategy Framework

A repeatable framework turns trading from guesswork into a process. Every educational setup in this book follows the same six-step sequence.

Framework Walkthrough

Trend

Establish market direction using structure and moving averages before anything else.

Pullback

Wait for price to retrace toward a meaningful level within that trend.

Level

Identify a specific support, resistance, or moving-average zone as your reference.

Confirmation

Look for a candlestick or volume signal that supports your idea before acting.

Entry / Stop / Target

Define exact entry, invalidation (stop-loss) and objective (target) before placing the trade.

CHAPTER 10

Breakout Setup

A breakout setup looks to enter as price clears a well-defined level with strong participation — capturing the start of a new directional move.

Setup Checklist

- ✓ Clear resistance level with multiple prior touches
- ✓ Tight consolidation forming just beneath the level
- ✓ Volume expansion accompanying the breakout candle
- ✓ Strong close near the high of the breakout candle
- ✓ Optional: wait for a retest of the broken level before entry

A breakout without volume is often a breakout without conviction.

CHAPTER 11

Pullback Setup

A pullback setup looks to join an established trend at a better price, after a controlled retracement toward support or a moving average.

Setup Checklist

- ☑ A strong, established trend already in place
- ☑ A controlled retracement — not a sharp reversal
- ☑ Retracement lands near a support zone or key moving average
- ☑ A confirmation candle signals buyers/sellers stepping back in
- ☑ Risk-defined entry with the stop placed beyond the pullback low/high

Pullbacks offer a better price — but only within a trend that is already proven.

CHAPTER 12

Risk Management

Protecting capital is the true foundation of a trading career. A trader who manages risk well can survive losing streaks and stay in the game long enough to improve.

Risk Per Trade

The amount of capital you are willing to lose on a single trade — typically kept to 1-2% of total capital.

Position Sizing

Calculating how many shares/lots to trade so that a stop-loss hit equals your defined risk amount.

Stop Loss

A predetermined exit point that caps losses if the trade moves against you — used without exception.

Risk / Reward

The ratio between potential loss and potential gain on a trade, ideally at least 1:2.

Maximum Daily/Weekly Loss

A hard limit on total losses within a period, which — once hit — stops all trading for that period.

Capital Protection

Preserving capital keeps you in the game; even the best strategies fail without capital to trade with.

POSITION SIZING FORMULA

$$\text{Position Size} = \text{Risk Amount} \div \text{Risk Per Share}$$

e.g. Risk Amount = 1% of capital, Risk Per Share = Entry - Stop Loss

CHAPTER 13

Risk / Reward & Expectancy

A trader does not need to win every trade to be profitable. What matters over time is the mathematical expectancy of the strategy being followed.

Win Rate % of trades that close in profit	Average Win Typical gain on a winning trade	Average Loss Typical loss on a losing trade	Risk / Reward Ratio of potential loss to potential gain
---	---	---	---

EXPECTANCY FORMULA

Expectancy = (Win% × Avg Win) - (Loss% × Avg Loss)

A positive expectancy means the strategy is profitable over a large sample size

Why You Don't Need to Win Every Trade

A trader with a 40% win rate and an average risk/reward of 1:3 can still be highly profitable — because the size of the wins outweighs the frequency of losses. Consistency in following the process, not the outcome of any single trade, is what compounds results over time.

CHAPTER 14

Trading Psychology

Strategy determines what to do. Psychology determines whether you'll actually do it. Most trading losses trace back to emotional decisions, not bad setups.

Emotional Traps

● **Fear**

Leads to hesitation and early, premature exits.

● **Greed**

Pushes traders to oversize positions or overstay winners.

● **FOMO**

Fear of missing out creates rushed, unplanned entries.

● **Revenge Trading**

Trying to immediately win back a loss, usually compounding it.

● **Overconfidence**

A winning streak leads to abandoning risk rules.

● **Impatience**

Entering before a setup is fully confirmed.

Disciplined Qualities

- Patience — waiting for the setup to fully qualify
- Discipline — following the plan regardless of emotion
- Loss Acceptance — treating losses as a cost of doing business

"Discipline is the real edge in trading, not prediction."

CHAPTER 15

Trading Journal

A trading journal turns raw experience into structured learning. Reviewed weekly, it reveals the patterns behind your wins and losses.

Journal Template

DATE	STOCK	SETUP	ENTRY	STOP	TARGET	SIZE	RESULT	EMOTION

Also Track Each Trade

- Mistake — what, if anything, went wrong in execution
- Lesson — the single takeaway to carry into the next trade
- Position size and actual R-multiple result

"A trading journal turns your mistakes into your biggest teacher."

CHAPTER 16

Backtesting & Practice

Before risking real capital, a strategy should be tested against historical data and then practised live in a demo environment to build confidence and consistency.

Why Backtesting Matters

Backtesting reveals whether a strategy has a real statistical edge before you risk live capital on it – it replaces assumption with evidence.

Sample Size

Test at least 30–50 trades before drawing conclusions

Win Rate

The % of historical trades that closed profitably

Average R

The average risk-multiple gained or lost per trade

Max Drawdown

The largest peak-to-trough decline during testing

Forward Testing / Demo Practice

Once a strategy shows a historical edge, practise it in a demo or very small live account. This builds muscle memory for execution under real-time conditions before scaling up size.

- 1 Define the strategy rules precisely, in writing
- 2 Backtest on historical charts across many samples
- 3 Record win rate, average R, and drawdown
- 4 Forward test on demo for at least 2–4 weeks
- 5 Only scale to live capital once results are consistent

CHAPTER 17

30-Day Trading Learning Roadmap

A structured month builds real competence. Follow each week in order — consistency beats intensity.

WEEK 1

Foundation

- Market structure & candlestick basics
- Support & resistance zones
- Trading psychology fundamentals
- Practice reading charts daily

WEEK 2

Technical Analysis

- Moving averages & chart patterns
- Volume analysis
- RSI, MACD, Bollinger Bands
- Identify setups on historical charts

WEEK 3

Strategy + Risk

- Build the strategy framework
- Practice position sizing
- Define risk-per-trade rules
- Backtest one complete strategy

WEEK 4

Execution + Review

- Forward test on demo account
- Maintain a daily trading journal
- Conduct a weekly performance review
- Refine your personal trading plan

GOAL Consistency beats intensity — small, repeated effort compounds into real skill.

CHAPTER 18

Trader Operating System

A repeatable operating rhythm — before, during and after every trade, plus a weekly review — keeps execution consistent and emotion-free.

BEFORE MARKET

- ✓ Check overall market direction & sentiment
- ✓ Review your watchlist and key levels
- ✓ Confirm you are mentally focused and rested
- ✓ Set maximum daily loss limit

DURING TRADE

- ✓ Follow entry rules exactly as planned
- ✓ Set stop-loss immediately after entry
- ✓ Avoid checking the position excessively
- ✓ Do not move your stop-loss further away

AFTER TRADE

- ✓ Log the trade in your journal immediately
- ✓ Note the emotion felt during the trade
- ✓ Identify any rule that was broken
- ✓ Avoid revenge trading after a loss

WEEKLY REVIEW

- ✓ Review all trades taken during the week
- ✓ Calculate win rate and average R
- ✓ Identify recurring mistakes or patterns
- ✓ Set one specific improvement goal

CHAPTER 19

Common Trader Problems

Nearly every trading mistake has a known, practical fix. Recognising the problem early is the first step toward solving it for good.

PROBLEM	SOLUTION
● No trading plan	→ Build and follow a written plan for every trade
● Overtrading	→ Set a hard daily/weekly trade limit
● No stop loss	→ Define invalidation before entering, always
● FOMO entries	→ Wait for full setup confirmation before acting
● Revenge trading	→ Stop trading after a predefined loss limit
● Ignoring risk rules	→ Risk only 1–2% of capital per trade
● Emotional decisions	→ Follow the plan; review emotion after, not during
● No performance review	→ Journal every trade and review weekly

CHAPTER 20

Personal Trading Plan

Fill in each field below to define your own rules. A written plan is the anchor that keeps decisions consistent when emotions run high.

Trading style	
Market	
Timeframe	
Setups I trade	
Entry rules	
Stop-loss rules	
Target rules	
Risk per trade	
Maximum trades per day	
Daily loss limit	
Review schedule	

Revisit and refine this plan monthly as your skill and consistency grow.

CHAPTER 21

Master Trading Checklist

A one-page reference of every essential rule in this book. Check it before you trade, and again at the end of every week.

- ☒ I understand market structure and trend direction
- ☒ I can read charts and identify key candlestick patterns
- ☒ I have a written trading plan
- ☒ I use proper risk management on every trade
- ☒ I always follow my stop-loss and target
- ☒ I maintain a trading journal for every trade
- ☒ I control my emotions instead of reacting to them
- ☒ I review my performance on a regular schedule
- ☒ I am patient and wait for full setup confirmation
- ☒ I am disciplined enough to follow my own rules

WEEKLY HABIT

Check this list every week — be a better trader, every day.

CHAPTER 22

The Final Word

“Trading is not about predicting every move. It is about managing risk, following a repeatable process, and improving over time.”

You now hold a complete educational framework — from reading a single candle to managing risk, tracking performance, and thinking like a disciplined trader. None of it guarantees profit. All of it builds the process that profitable traders rely on.
