Before You Start

This book is an educational guide.

Trading involves risk. No strategy, indicator, setup or methodology can guarantee profits.

Your goal as a beginner should not be:

“How quickly can I make money?”

Instead ask:

“How can I build a repeatable decision-making process?”

SEBI notes that leveraged derivatives can produce disproportionate gains and losses, and losses can potentially be substantial.

Therefore, this book focuses heavily on:

Knowledge → Planning → Risk Control → Execution → Review

Never trade money that you cannot afford to lose.

Understanding the Game Before Playing It

A stock represents ownership in a company.

When you buy shares, you are purchasing a financial security representing an ownership interest in that company. The stock market provides a marketplace where securities can be bought and sold.

But there are two completely different approaches:

Investing

Usually focuses on longer-term ownership and business performance.

Trading

Focuses more on shorter-term price movements and predefined trade opportunities.

Simple Example

Suppose a stock is trading at ₹100. You believe it may move toward ₹115. A trading plan might define: Entry ₹100, Stop ₹95, Target ₹115.

The important point is not whether the stock reaches ₹115.

The important point is whether you had a defined plan before entering.

Know What You Are Actually Doing

Investing	Trading
Longer-term	Shorter-term
Business-focused	Price/market-focused
Fundamental research often important	Technical analysis often important
Lower frequency	Higher frequency
Patience is critical	Execution is critical

Trading itself has different forms.

Major Trading Styles

Intraday — Positions generally opened and closed within the same trading session.

Swing Trading — Positions may be held for several sessions or weeks depending on the setup.

Positional Trading — Usually involves holding positions for longer periods.

NSE's educational material explicitly covers intraday, swing and positional approaches as different trading strategy categories.

Price Is the Main Language of the Market

A chart shows the historical behaviour of price. Price is influenced by the interaction between buyers and sellers.

Think in Terms Of

DEMAND — More buying interest.

SUPPLY — More selling interest.

When demand becomes stronger relative to available supply, price may rise. When selling pressure dominates, price may fall.

Your First Objective

Don't try to predict every candle. Learn to identify:

- Trend
- Structure
- Key levels
- Momentum
- Volume

Learn to Read Price Behaviour

A standard candlestick contains:

OPEN — Where the period began.

HIGH — Highest price during the period.

LOW — Lowest price.

CLOSE — Where the period ended.

The candle body shows the relationship between open and close. The wicks show the high and low reached during the period.

What Candles Can Tell You

- Buying pressure
- Selling pressure
- Rejection
- Momentum
- Uncertainty

But one candle should rarely be treated as a complete trading strategy. Context matters.

A quick reference to the most common bullish and bearish reversal candlestick patterns.

Find the Important Zones

SUPPORT — An area where price has previously found buying interest.

RESISTANCE — An area where price has previously encountered selling pressure.

Think of them as zones, not always exact single-price lines.

Example

Stock: ₹100 → ₹110 → ₹100 → ₹115 → ₹100

The ₹100 region may deserve attention because price repeatedly reacted around that area.

Important: Support can break. Resistance can break.

*Level + Price Reaction + Context
is more useful than blindly buying at every support.*

Learn to See the Bigger Picture

UPTREND — Generally: Higher High + Higher Low

DOWNTREND — Generally: Lower High + Lower Low

RANGE — Price moves between relatively defined boundaries without a clear directional trend.

Simple Process

Before entering any trade ask:

- What is the trend?
- Where is the current price?
- What structure is forming?
- Where would my idea become invalid?

This helps prevent random entries.

One Tool, Not a Magic Formula

Moving averages smooth price data and can help traders study trend direction.

Common Examples Include

- 20 EMA
- 50 EMA
- 200 EMA

These numbers are not magical. Different traders use different settings.

Example Use

- 50 EMA → medium-term trend context
- 200 EMA → longer-term trend context

But an indicator should support your analysis—not replace it.

Never buy a stock simply because price crossed a moving average.

Study: Price + Structure + Volume + Context

NSE technical-analysis material includes moving-average systems among the tools used to analyse markets.

Understanding Momentum

RSI is a momentum indicator that can help study the speed and magnitude of recent price movements.

A commonly used RSI scale runs from 0 to 100. Many traders watch:

- Above 70 → potentially overbought context
- Below 30 → potentially oversold context

But: overbought does not automatically mean “sell.” Oversold does not automatically mean “buy.” Strong trends can remain overbought or oversold for extended periods.

Use RSI as context, not as a guaranteed signal.

NSE's current technical-analysis curriculum includes RSI among momentum indicators.

Price Shows What Happened. Volume Adds Context.

Volume tells you how much trading activity occurred during a period.

Example

Suppose a stock breaks resistance.

Scenario A: Breakout + strong increase in volume

Scenario B: Breakout + weak participation

These two situations may deserve different levels of scrutiny.

Is participation supporting the move?

Volume should not be used alone. Combine it with: Price + Structure + Trend.

Patterns Are Frameworks, Not Guarantees

Some commonly studied patterns include:

Continuation

- Flag
- Pennant
- Rectangle
- Triangle

Reversal

- Double Top
- Double Bottom
- Head & Shoulders

Important Rule

A pattern is not automatically a trade. You still need:

- Entry
- Invalidation
- Risk
- Position Size
- Exit

NSE educational materials cover classical chart patterns and candlestick patterns as part of technical analysis.

Not every breakout is equal — comparing weak vs. strong breakout candle structure.

Capture the Swing, Not Every Move

Swing trading attempts to capture a meaningful price movement over multiple sessions.

Basic Process

- SCAN — Find candidates.
- ANALYZE — Study trend and structure.
- PLAN — Entry + Stop + Target.
- EXECUTE — Take only valid setups.
- MANAGE — Follow your rules.
- REVIEW — Study the result.

The Swing Trader's Mindset

*You don't need to catch the entire movement.
You need a defined part of the movement that fits your plan.*

Build a Watchlist

Don't randomly select stocks. Create filters.

Basic Watchlist Checklist

- ☐ Adequate liquidity
- ☐ Healthy trading activity
- ☐ Clear structure
- ☐ Understandable trend
- ☐ Reasonable volatility
- ☐ No dependence on rumours
- ☐ Setup approaching

Three Categories

A — Ready: Setup almost complete.

B — Developing: Potential setup forming.

C — Observe: Interesting but not currently actionable.

Watchlist ≠ Buy List

Trading a Breakout Framework

A breakout occurs when price moves beyond an established area of resistance or consolidation.

Look For

- Clear resistance
- Consolidation
- Price expansion
- Participation/volume context
- Defined invalidation
- Reasonable potential reward

Example

Resistance: ₹100. Price consolidates: ₹95–₹100. Then price moves above ₹100.

Is this a genuine change in structure or a temporary spike?

Your plan should define what confirms the setup.

Don't Chase Every Rally

A pullback occurs when price temporarily moves against the prevailing trend.

Example: Uptrend → Pullback → Support / Confirmation → Continuation

Look For

- Existing trend
- Previous support
- Controlled pullback
- Price reaction
- Confirmation
- Defined invalidation

Key Question

Is the stock pulling back within the trend—or actually reversing?

You don't need certainty. You need a predefined point where the idea is proven wrong.

Never Enter Without Knowing Your Exit

Before placing an order, write:

STOCK: _____

SETUP: _____

ENTRY: ₹ _____

STOP: ₹ _____

TARGET: ₹ _____

RISK/SHARE: ₹ _____

QUANTITY: _____

REASON FOR TRADE: _____

INVALIDATION: _____

*If you cannot explain the trade in a few sentences,
you may not understand the setup well enough.*

TRADING PLAN

— ENTRY, EXIT AUR TARGET —
— PEHLE DECIDE KARO. —

TRADING PLAN KYU ZAROORI HAI?

- ✓ Emotion ko control karta hai
- ✓ Consistency banata hai
- ✓ Risk management improve karta hai
- ✓ Long term profit me help karta hai

— TRADING PLAN KE 5 MAIN POINTS —

1 MARKET ANALYSIS

- Trend Analysis (Higher Timeframe)
- Support & Resistance
- Chart Pattern / Price Action
- Indicator Confirmation (agar use karte ho)

2 ENTRY PLAN

- Kis price par entry leni hai?
- Kis condition par entry confirm hogi?
- Limit Order ya Market Order?

3 STOP LOSS PLAN

- Stop loss kahan lagana hai?
- Risk kitna lena hai?
- Total capital ka 1-2% se zyada risk na lo.

4 TARGET PLAN

- Target kahan set karna hai?
- Risk:Reward minimum 1:2 ya usse better.
- Multiple target set kar sakte ho.

5 EXIT PLAN

- Target hit hone par exit.
- Trailing Stop use kar sakte ho.
- Time-based exit (agar setup kaam na kare to nikal jao).

PLAN KO HAR TRADE SE PEHLE CHECK KARO

- ✓ Kya setup clear hai?
- ✓ Kya risk 1-2% se kam hai?
- ✓ Kya risk:reward sahi hai?
- ✓ Kya mera mind calm aur focused hai?

★ **PLAN THE TRADE, TRADE THE PLAN** ★

Building a complete plan: market analysis, entry, stop-loss, target and exit rules.

Define Your Invalidation

A stop-loss should be connected to the trade idea.

Suppose: Entry = ₹100. Your thesis depends on price holding ₹95.

Then: ₹95 may become the invalidation area.

The important question is not:

“How much loss can I tolerate?”

The better question is:

“At what price is my original trade idea no longer valid?”

Then position size can be calculated based on that risk.

Stop-loss orders also have execution limitations during fast or unusual market conditions; investors should understand how order types work before relying on them.

Control the Amount You Risk

$$\text{Position Size} = \text{Maximum Planned Risk} \div \text{Risk Per Share}$$

Example

Capital = ₹20,000

Planned risk = ₹200

Entry = ₹250

Stop = ₹240

Risk/share = ₹10

Quantity: $₹200 \div ₹10 = 20$ shares

Capital used: $20 \times ₹250 = ₹5,000$

This example is for learning the calculation, not a recommended risk level.

Golden Principle

*Position size should adapt to risk.
Not: risk should adapt to your position size.*

Think Beyond “Will It Go Up?”

Suppose: Entry = ₹100, Stop = ₹95, Risk = ₹5, Potential target = ₹115, Potential reward = ₹15

$$\text{Risk : Reward} = 1 : 3$$

Risk-reward does not predict whether a trade will succeed. It simply helps you compare the potential payoff with the amount you are putting at risk.

Before a Trade

- Risk = ?
- Potential Reward = ?
- Is the setup reasonable?

Protect the Trading Account

Your trading capital is your business inventory. If you repeatedly take oversized losses, your ability to continue trading declines.

Avoid

- One huge trade

- Revenge trading
- Increasing size after losses
- Random averaging
- Borrowing money to trade
- Trading emergency funds

Build a Risk Framework

Define beforehand:

- Maximum risk per trade
- Maximum daily/weekly loss
- Maximum open positions
- Maximum portfolio exposure

Your exact numbers should reflect your own circumstances and risk tolerance.

The Biggest Battle Is Often Internal

FOMO — Fear of missing out.

GREED — Wanting more after a profitable move.

FEAR — Exiting good trades too early.

REVENGE — Trying to recover a loss immediately.

OVERCONFIDENCE — Increasing risk after winning.

BOREDOM — Taking trades simply because the market is open.

The Solution

Create rules before emotions appear. Your system should answer:

- When do I enter?
- When do I exit?
- How much do I risk?
- When do I stop trading?

Turn Your Trades Into Data

Record every trade.

Date: _____

Stock: _____

Setup: _____

Entry: _____

Stop: _____

Target: _____

Quantity: _____

Exit: _____

P/L: _____

Review

- Why did I enter?
- Did I follow my rules? YES / NO
- What did I do well?
- What mistake did I make?
- What will I improve?

PAGE 24 — BACKTESTING

Test Before You Trust

Backtesting means examining how a defined trading rule would have behaved using historical data.

Example

Strategy: Breakout + Volume Confirmation

You could review historical examples and record:

- Entry
- Stop
- Target
- Result
- Maximum adverse movement
- Maximum favourable movement

Important

A historical result does not guarantee future performance. Markets change. Execution differs. Costs matter. And a strategy can behave differently in different market conditions.

Goal: Test → Record → Analyze → Improve

PAGE 25 — BUILD YOUR OWN STRATEGY

Stop Collecting Random Indicators

A trading strategy should answer five questions:

1. WHAT? What setup am I trading?

2. **WHEN?** What confirms entry?
3. **WHERE?** Where is invalidation?
4. **HOW MUCH?** How large is my position?
5. **WHEN OUT?** What is my exit rule?

Strategy Template

Market: _____

Timeframe: _____

Setup: _____

Entry: _____

Stop: _____

Target: _____

Position Size: _____

Exit Rule: _____

No-Trade Condition: _____

PAGE 26 — ADVANCED TECHNICAL ANALYSIS

Move Beyond the Basics

Once you understand the fundamentals, you can explore:

Trendlines — Identify directional structure.

Channels — Study price movement between boundaries.

Fibonacci — A framework some traders use to study potential retracement areas.

ATR — A volatility measure that can help contextualize price movement and stop placement.

Bollinger Bands — A volatility-based technical tool.

Momentum — Study acceleration/deceleration of price movement.

More indicators do not automatically mean better analysis.

NSE's advanced technical-analysis curriculum includes tools such as Fibonacci, swings, candlestick/chart patterns, volatility tools and ATR-based risk concepts.

PAGE 27 — MARKET CONDITIONS

Your Strategy Must Understand the Environment

Markets can behave differently.

TRENDING MARKET — Price moves with a clearer directional bias. Potential focus: trend continuation.

RANGE-BOUND MARKET — Price moves between defined areas. Potential focus: range support/resistance.

HIGH-VOLATILITY MARKET — Price moves rapidly. Potential response: reduce exposure / demand stronger confirmation / reassess risk.

Key Lesson

A strategy that works well in one environment may behave differently in another. Therefore always ask:

“What type of market am I currently trading?”

PAGE 28 — ADVANCED TRADING: DERIVATIVES

Understand Before You Touch

Derivatives include instruments such as Futures and Options. They are not simply “advanced stocks.” They have different mechanics and risks.

Leverage can magnify both gains and losses. SEBI specifically warns that derivatives can involve high risk and that losses can be substantial.

Before Studying Derivatives, Understand

- ✓ Underlying asset
- ✓ Contract size
- ✓ Expiry
- ✓ Margin
- ✓ Volatility
- ✓ Leverage
- ✓ Liquidity
- ✓ Option premium
- ✓ Time decay
- ✓ Risk management

Understand the instrument before using the instrument.

PAGE 29 — YOUR 90-DAY TRADING MASTER PLAN

A Structured Path Forward

Phase 1 — Days 1-30: Foundation

Learn:

- Market basics

- Candlesticks
- Support/resistance
- Trend
- Volume
- Risk management
- Position sizing

No need to rush.

Phase 2 — Days 31-60: Practice

Build:

- Watchlist
- One or two setups
- Paper trades
- Trading journal
- Backtesting records

Focus on following rules.

Phase 3 — Days 61-90: System Building

Review your data. Identify:

- Best setup
- Common mistake
- Average risk
- Average result
- Market condition
- Execution problems

Then create your Personal Trading Plan.

Building a trading skill is a journey — consistency today compounds into freedom tomorrow.

PAGE 30 — THE FQORE TRADING BLUEPRINT

Your Personal Trading System

Fill this before you trade.

MY TRADING STYLE: _____

MY MARKET: _____

MY TIMEFRAME: _____

MY PRIMARY SETUP: _____

MY ENTRY RULE: _____

MY STOP-LOSS RULE: _____

MY POSITION-SIZING RULE: _____

MY EXIT RULE: _____

MY MAXIMUM RISK: _____

MY NO-TRADE CONDITIONS: _____

MY JOURNAL SYSTEM: _____

MY 90-DAY GOAL: _____

FINAL MESSAGE

YOU DON'T NEED TO PREDICT EVERY MOVE.

You need a process.

Learn · Observe · Practice · Plan · Manage Risk · Execute · Review · Improve · Then repeat.

*"The goal isn't to become someone who is right on every trade.
The goal is to become someone who can make structured decisions under uncertainty."*
